March 7, 2019

SPECIFICATION SHEET: CMV_C3 2016beta Platform

Description: Category 3 Commercial Marine Vessel (cmv_c3) emissions, for simulating 2016 air quality

---

1. EXECUTIVE SUMMARY

Commercial Marine Vessel (CMV) emissions for ships with Category 3 (i.e., large) engines are modeled in the cmv_c3 sector as point sources. The cmv_c3 sector includes emissions in U.S. state and federal waters, and areas beyond U.S. federal waters. The 2016 beta platform includes projections of cmv_c3 emissions from the 2014 National Emissions Inventory version 2 (NEI2014v2) to 2016. Base year inventories were processed with the Sparse Matrix Operating Kernel Emissions (SMOKE) modeling system version 4.6. National and state-level emission summaries for key pollutants are provided.

2. INTRODUCTION

This document details the approach and data sources used for developing 2016 emissions for the Commercial Marine Vessel, Category 3 (cmv_c3) sector. The 2016 beta platform cmv_c3 inventory was projected to 2016 from the U.S. EPA NEI2014v2[1] nonpoint inventory, and then converted to a point inventory format to support simulating plume rise for these sources.

The cmv_c3 sector contains large engine CMV emissions. Category 3 (C3) marine diesel engines are those at or above 30 liters per cylinder, typically these are the largest engines rated at 3,000 to 100,000 hp. C3 engines are typically used for propulsion on ocean-going vessels including container ships, oil tankers, bulk carriers, and cruise ships. Emissions control technologies for C3 CMV sources are limited due to the nature of the residual fuel used by these vessels.[2]
The cmv_c3 sector contains sources that traverse state and federal waters and that are in the NEI2014v2; plus sources in waters not covered by the NEI. Where the Category 3 CMV (cmv_c3) inventory is modeled as point sources with plume rise, the cmv_c1c2 sources are modeled as area sources with emissions that occur only near the Earth's surface.

The cmv_c3 sources that operate outside of state waters but within the federal Emissions Control Area (ECA) are encoded with a Federal Information Processing Standard (FIPS) state code of 85. The ECA areas include parts of the Gulf of Mexico, and parts of the Atlantic and Pacific coasts. As the U.S. federal waters around Puerto Rico and Alaska are outside the continental U.S. (CONUS) modeling domain, cmv_c3 sources for these regions are not included in the 2016beta inventory. The cmv_c3 sources in the 2016beta inventory are categorized as operating either in-port or underway and are encoded using the two source classification codes (SCCs) listed in Table 1. In addition to C3 sources in state and federal waters, the cmv_c3 sector includes emissions in waters not covered by the NEI (FIPS = 98) and taken from the "ECA-IMO-based" C3 CMV inventory[3]. The ECA-IMO inventory is also used for allocating the county-level emissions to geographic locations.

Table 1. 2016 beta platform SCCs for cmv_c3 sector

SCC	Tier 1 Description	Tier 2 Description	Tier 3 Description	Tier 4 Description
2280003100	Mobile Sources	Marine Vessels, Commercial	Residual	Port emissions
2280003200	Mobile Sources	Marine Vessels, Commercial	Residual	Underway emissions

3. INVENTORY DEVELOPMENT METHODS

Development of the 2016 beta platform cmv_c3 inventory consisted of two steps: converting the NEI2014v2 nonpoint C3 emissions to point format, and projecting those emissions to year 2016. These steps are described below.

Conversion of NEI2014v2 nonpoint C3 to point format

The NEI2014v2 nonpoint C3 inventory was converted to a point inventory to support plume rise calculations for C3 vessels. The nonpoint emissions were allocated to point sources using a multi-step allocation process because not all of the inventory components had a complete set of county-SCC combinations. In the first step, the county-SCC sources from the nonpoint file were matched to the county-SCC points in the 2011 ECA-IMO C3 inventory. The ECA-IMO inventory contains multiple point locations for each county-SCC. The nonpoint emissions were allocated to those points using the $PM_{2.5}$ emissions at each point as a weighting factor.

The cmv_c3 port emissions, which did not have a matching FIPS in the ECA-IMO inventory, were allocated using the 2016 port shapefiles obtained from the EPA Office of Transportation and Air Quality (OTAQ). The contribution fraction of $PM_{2.5}$ from each county that overlapped with the port area polygon was calculated as an initial weighting factor. The port polygons were then drawn with an overlapping 4 km resolution modeling grid on a Lambert Conformal Conic projection. The fraction of the area of each grid cell overlapping the port polygon was calculated as a second weighting factor. The centroids of the grid cells overlapping each port was obtained and grouped by county FIPS. A final area-to-point allocation factor was calculated using the product of the two weighting factors at each centroid point and normalizing the sum of all weighting factors in a county to unity. Any remaining unmatched counties with port emissions from the area inventory were allocated to the centroids of the cells in the 12 km 2014 port area spatial surrogate (surrogate code 801). The emissions for those counties were allocated using the weighting factors in the surrogate.

The cmv_c3 underway emissions that did not have a matching FIPS in the ECA-IMO inventory were allocated using the 12 km 2014 offshore shipping activity spatial surrogate (surrogate code 806). Each county with underway emissions in the area inventory was allocated to the centroids of the cells associated with the respective county in the surrogate. The emissions were allocated using the weighting factors in the surrogate.

The resulting point emissions were converted to an annual point 2010 flat file format (FF10). Pictures of the emissions are shown in Section 7 of this document. A set of standard stack parameters were assigned to each release point in the cmv_c3 inventory. The assigned stack

height was 65.62 ft, the stack diameter was 2.625 ft, the stack temperature was 539.6 °F, and the velocity was 82.02 ft/s.

Projection of NEI2014v2 point C3 to 2016

Projections of the NEI2014v2 cmv_c3 emissions to the year 2016 were based on United States Army Corps of Engineers' Entrance and Clearance (E&C) data. Those data were used to estimate the change in commercial shipping activity between 2014 and 2016. E&C data includes records of each entrance and clearance of a port by any vessel involved in international commerce annually. The data do not include information for Jones Act Ships, which are U.S.-owned and U.S.-crewed ships that transit exclusively between U.S. ports. E&C data from 2014 and 2015 were used to determine C3 marine vessel trips by region, engine type, and year built.

In 2014, marine vessels in the North American Emission Control Area (ECA), which extends 200 miles from the shores of North America, Puerto Rico, and the Virgin Islands, met a fuel sulfur standard of 10,000 ppm. On January 1st, 2015, the ECA initiated a fuel sulfur standard which regulated large marine vessels to use fuel with 1,000 ppm sulfur or less. EPA multiplied European Union (EU)[4] C3 emissions factors that include these standards with the E&C calls of the respective years.

The EU emission factors also reflect IMO Tier 3 NOx regulations that apply to engines installed on ships constructed (i.e., keel is laid) on or after January 1st, 2016. However, in allotting time for ship building and engine installation, EPA does not expect Tier 3 vessels to be active by December 31st, 2016. Therefore, the 2016 regional fleet population was assumed to be the same as that of 2015, and the appropriate emission factors were applied. The final growth factors were determined by dividing the 2016 sum of the products of emission factors and calls by that of 2014 per pollutant and region.

The cmv_c3 projection factors are pollutant-specific and region-specific. Most states are mapped to a single region with a few exceptions. Pennsylvania and New York were split between the East Coast and Great Lakes, Florida was split between the Gulf Coast and East Coast, and Alaska was split between Alaska East and Alaska West. The 2014-to-2016 projection factors for C3 sources are listed in Table 2. The Non-Federal factors listed in this table were applied to sources outside of U.S. federal waters (FIPS 98). Volatile Organic Compound (VOC) Hazardous Air Pollutant (HAP) emissions were projected using the VOC factors. NH3 emissions were held constant at 2014 levels.

South Pacific	-10.36%	-11.57%	-62.17%	-63.68%	-91.05%	-10.31%
Virgin Islands	-20.01%	-19.80%	-66.57%	-67.49%	-91.80%	-19.59%
Non-Federal	5.98%	5.98%	5.98%	5.98%	5.98%	5.98%

4. ANCILLARY DATA

Spatial Allocation

The 2016beta platform cmv_c3 emissions are point sources and are allocated directly to grid cells within SMOKE. Details regarding the conversion of the area source NEI2014v2 cmv_c3 inventory to the 2016beta platform point source format are available in Section 3 of this document.

Temporal Allocation

Month-of-year temporalization for emissions in the Great Lakes used 2014-based monthly profiles provided by LADCO[5]. For the rest of the sector, month-of-year temporalization used a monthly temporal profile that was first developed for C3 emissions for an earlier EPA emissions modeling platform. As the day-of-week and hour-of-day temporal profiles are flat for all cmv_c3 sources, air quality model-ready emissions were only prepared for one representative day per month. Table 3 lists the annual total 2016 emissions assigned to different monthly temporal profiles. The Great Lakes vessels use the profiles that include "GLCMV" in the monthly profile name; the rest of the cmv_c3 sources used profile "19531". Figure 1 is a plot of the Great Lakes monthly temporal profiles used for the 2016beta emissions.

[5] Details are available in the workbook TemporalProfiles_byLake_UNC_14Mar2017.xlsx

Table 3. 2016 cmv_c3 emissions by monthly temporal profile (includes federal waters but not non-US sources)

Monthly profile	CO	NH3	NOX	PM10	PM2.5	SO2	VOC
19531	57,519	100	592,149	8,021	7,157	15,777	26,083
GLCMV1	4	0	44	1	1	1	2
GLCMV10	21	0	173	4	3	6	6

GLCMV8	6	0	51	2	1	2	3
GLCMV9	1	0	4	0	0	0	0

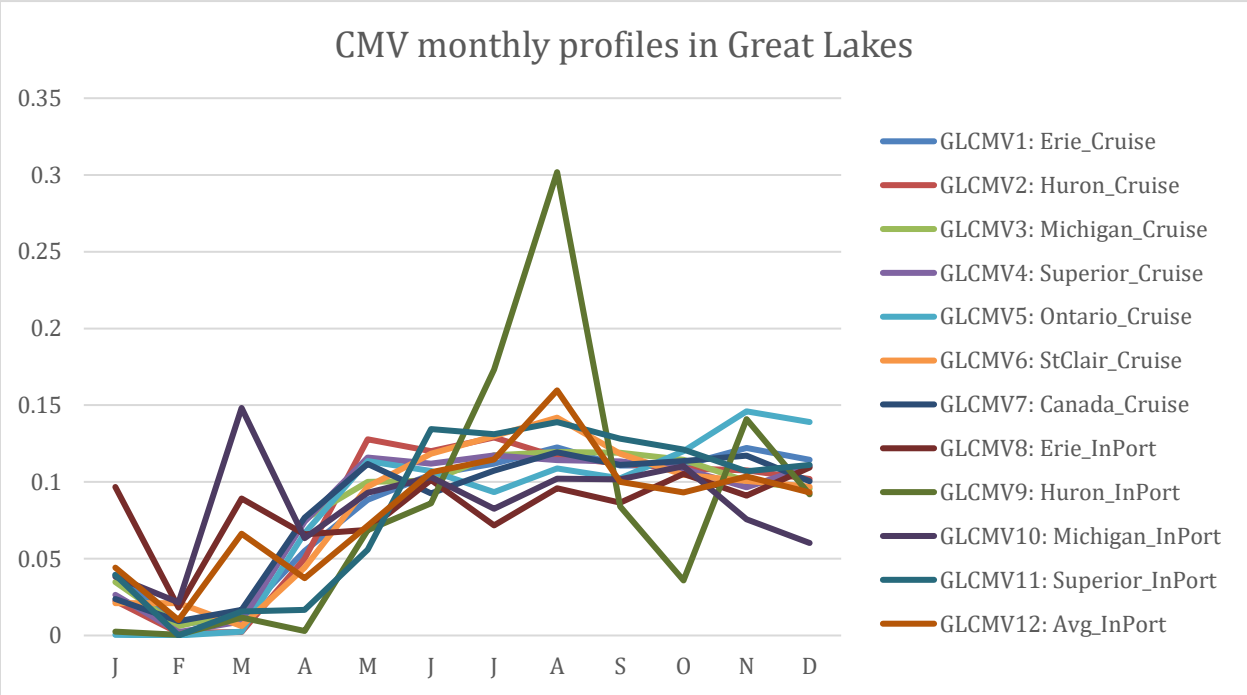

Figure 1. CMV Great Lakes 2014-based monthly temporal profiles

Chemical Speciation

The cmv_c3 sector includes emissions for particulate matter < 2.5 μm ($PM_{2.5}$), oxides of nitrogen (NOx), and VOC, among other criteria pollutants. These three inventory pollutants must be converted to air quality modeling species through an emissions processing step referred to as "chemical speciation". The U.S. EPA SPECIATE[6] database was used to develop factors to map the inventory species to the chemical species required for air quality modeling.

[6] https://www.epa.gov/air-emissions-modeling/speciate-version-45-through-40

All of the emissions in the cmv_c3 sector were assigned the $PM_{2.5}$ speciation profile 5675AE6 (Marine Vessel – Auxiliary Engine – Marine Gas Oil) and the VOC speciation profile 2480 (Industrial Cluster, Ship Channel, Downwind Sample). 5675AE6 is an update of profile 5675 to support AE6 PM speciation. The components of these profiles are shown in Table 4 and Table 5. Note that because the entire cmv_c3 sector is integrated, so the NONHAPTOG profile is used instead of the VOC profile. The VOC-to-TOG conversion factor for profiles 2480 is 1.033. In the profile, SOAALK is an extra tracer, so the factors sum to 1.0 if SOAALK is excluded from the sum. The cmv_c3 NOx emissions were speciated using a 90:9.2:0.8 split for NO:NO2:HONO.

5. Emissions Projection Methods

Future year projections for the 2016 beta platform have not yet been finalized at the time this was written.

6. Emissions Processing Requirements

CMV_c3 emissions were processed for air quality modeling using the Sparse Matrix Operator Kernel Emissions (SMOKE[7]) modeling system. Because day-of-week temporalization is flat for all sources, a single representative day per month is processed. This cmv_c3 sector was processed through SMOKE as point sources. This is a 3-D sector in which all emissions are output to an inline point source file to support plume rise calculations within the air quality model. No 2-D gridded emissions were generated for this sector.

7. Emissions Summaries

Table 6 compares annual, national total cmv_c3 emissions for the 2016 beta platform to cmv_c3 emissions from previous modeling platforms. Table 7 shows national totals by SCC for US state and federal waters. Table 8 and Table 9 show comparisons for state total NOx and SO_2 emissions, respectively. Figure 2 and Figure 3 are gridded emissions plots of annual total NOx and SO_2. Additional plots and maps are available online through the LADCO website[8] and the Intermountain West Data Warehouse[9]. Descriptions of the emissions platform cases shown in the tables and plots below are as follows:

2011en, 2023en, 2028el = Final 2011, 2023, and 2028 cases from the 2011v6.3 platform

2014fd = NEI2014v2 and 2014 NATA

2016fe = 2016 alpha platform (grown from NEI2014v2)

2016ff = 2016 beta platform
